Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.169; Variance 144.272; scale 0.216

ᅜ	New cell cycle regulating proteins bind to cyclin dependent kinase -
ď	and related nucleic acids, antibodies etc., used in diagnosis and
딥	therapy of abnormal cell proliferation, degeneration etc.
PS	Claim 1; Page 76-77; 109pp; English.
႘	The human cell-cycle regulatory (CCR) protein p16 (R85116) was
ខ	obtd. by expression of a cDNA clone (T02962) isolated in a 2-hybrid
ပ္ပ	screening assay. CCR p16 specifically inhibits the activity of
႘	cyclin-dependent kinases during various stages of the cell cycle,
႘	and can be used in the treatment and diagnosis of proliferative
ပ္ပ	disorders.

This is the amino acid sequence of the multiple tumour suppressor I this is the amino acid sequence of the multiple tumour suppressor I this is the amino acid sequence of the multiple tumour. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for secen for drugs to be used for cancer therapy, and the protein scene for drugs to be used for cancer therapy, and the protein selection in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

MTS1. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosts of predisposition to cancers. e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.

Expression construct contg. DNA for tumour suppressor p16 - to restore p16 activity to transformed cells, useful for treating lung or bladder cancer or melanoms.

To bladder cancer or melanoms.

This sequence represents the tumour suppressor p16. The DNA encoding this sequence is joined to a promoter functional in enkaryotic cells and used in the expression construct of the invention. p16 is an inhibitory subunit, which is involved in the control of cyclin-dependent kinase 4 activity, and functions as a tumour suppressor. By detecting this sequence or the DNA encoding it, cancer cells can be detected. When the nucleic acid molecule is in the sense orientation, the expression construct can be used to restore p16 function in a cell, particularly by reversing the transformed phenotype in tumours, especially lung or bladder cancer or melanoma. It may also have anti-angiogenic activity, and inhibit hyperproliferative disorders, e.g. restenosis. When the nucleic acid molecule is inserted in the antisense orientation, the capression construct inhibits p16 function. Reduced or increased levels of p16, or a related nucleic acid, may be diagnostic of tumours, e.g. by Southern or Northern blot, antibody immunoblot, fluorescent cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-MAY-1999 (first entry)

CDKs), particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (i) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at Least one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (ii) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ELLLLHGAEPNCADPATLTRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLAEE 120

delivering the GCs to a cell for transfection. Also provided are nucleic acids encoding a fusion protein (FP) containing: (1) a therapeutic collyppide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (11) a transcellular consists of at least one CDF-binding motif and a TCP. (A) are used to treat vascular wounds that involve a break in the endothelium and excessive proliferation of smooth muscle, particularly restenosis but core spencially any repair of cardiovascular damage, arteriosclerotic escions or for endothelialisation of synchiat vascular grafts. More generally, FP are used to treat unwanted cellular proliferation in a very wide range of situations, e.g. for treating vascular diseases as above; throris disorders (e.g. rheumatoid arthritis, diabetes, cirrhosis); many tumours (gliomas, leukaemias); chronic inflammation; neurodegeneration; cane; also to control hair growth (e.g. to prevent hair loss caused by chemotherapy or radiation); periodortal disease; to treat tachycardia; to inhibit spermatogenesis etc. Chimaeric proteins comprising CDK-binding coulisits from two or more different proteins bind to CDRs so inhibit cell cycle progression, particularly smooth muscle cell proliferation. The gene constructs may also be used to produce FP in cell cultures, for production or for regulating cell differentiation in vitro. The present sequence represents a human p27-pl6 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This sequence represents a chimeric polypeptide of the invention. It was derived from a fusion of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the invention have cyclin-dependent kinase (CDK) binding motifs from at least two different proteins that bind to CDKS. The protein controls proliferation and/or differentiation of cells,

```

particularly they inhibit cell-cycle progression. They can be used to treat a wide range of proliferative disorders, e.g. cancer, leukaemia, psorlasis, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation or degeneration of tissue, e.g. Alzheimer's, Parkinson's or Huntington's diseases, gastric ulcers and autonomous diseases of the peripheral nervous system. Other applications include reducing growth of hair and protecting hair follicle cells against cytotoxic treatments, cosmetically to treat various forms of folliculitis, and to inhibit spermatogenesis or cogenesis. The chimeric proteins can also be used in vitro to maintain cells, especially neurons intended for testing specific activity of trophic factors, at selected points in the cell cycle. The protecting are more active inhibitors of the CDK/cyclin complex than binding motifs used individually (since they may bind to CDK involved in different stages of the cell cycle) Sequence 391 8888888888888888888

differentiation, 101 teacher of, e.g., vascular injury, cancers, claim 63; Page 85; 88pp; English.

Claim 63; Page 85; 88pp; English.

The invention relates to novel inhibitors of cyclin-dependent kinases (TDKs), particularly CDK/cyclin complexes. It provides a recombinant cransfection system (A) that comprises: (1) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at last one CDK-binding motif for binding and inhibiting activity of a CDK, inked to a transcription regulator functional in eukaryotic cells; (11) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (111) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic acids encoding a fusion protein (FP) containing: (1) a therapeutic collypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (11) a transcellular process when FP enters the cell, and (11) a transcellular process when FP enters transcytosis of FP. The FP

Claim 63; Page 85; 88pp; English.

Comprising a sequence encoding a complexes. It provides a recombinant

Comprising a sequence encoding an inhibitory polypeptide containing at
comprising a sequence encoding an inhibitory polypeptide containing at
comprising a sequence encoding an inhibitory polypeptide containing to
comprising a sequence encoding an inhibitory polypeptide containing to
comprising a tusion metal for binding and inhibiting activity of a CDK,
linked to a transcription regulator functional in eukaryotic cells; (ii)
second gene construct comprising a sequence encoding a polypeptide that
concess endothelialisation, and (iii) a gene delivery composition for
delivering the GCs to a cell for transfection. Also provided are nucleic
collypeptide sequence (TP) from an intraccillular protein that alters a
cellular process when FP enters the cell, and (ii) a transcellular
collypeptide sequence (TP) from an intraccillular protein that alters
consists of at least one CDK-binding motif and a TCP. See X26220 for
consists of at least one CDK-binding motif and a TCP. See X26220 for
consists of a human truncated p27/pl6 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                     25-MAY 1999 (first entry)
Truncated p27/pl6 fusion protein.

Claim 63; Page 83; B8pp; English.

The invention relates to novel inhibitors of cyclin-dependent kinases the invention relates to novel inhibitors of cyclin-dependent kinases (CDKS), particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (1) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at last one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (1) second gene construct comprising a sequence encoding a polypeptide that promotes endothellalisation, and (111) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic acids encoding a fusion protein (FP) containing: (1) a therapeutic polypeptide sequence (TP) from an intraccillular protein that alters a cellular process when FP enters the cell, and (11) a transcellular collypeptide sequence (TP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See x26220 for detailed uses of the recombinant transfection system. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                         Truncated p27/p16 fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a chimeric polypeptide of the invention. It was derived from a fusion of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the invention have cyclin-dependent kinase (CDK) binding motifs from at least two different proteins that bind to CDKs. The protein controls proliferation addor differentiation of cells, carriarly they inhibit cell-cycle progression. They can be used to particularly they inhibit cell-cycle progression. They can be used to particularly they inhibit cell-cycle progression. They can also treat diseases associated with de-differentiation or confidence of itssue, e.g. Alzheimer's, Parkinson's or Hunington's diseases, gastric ulcers and autonomous diseases of the peripheral nervous system. Other applications include reducing growth of hair and contrast training common include reducing growth of hair and contrast various forms of folliculitis, and to inhibit spermatogenesis or cells, especially neurons intended for testing specific activity of crophic factors, at selected points in the cell cycle. The proteins are more active inhibitors of the CDK-cyclin complex than binding motifs used the contrast than binding motifs used the contrast of the CDK-cyclin complex than binding motifs used the contrast of the CDK-cyclin complex than binding motifs used the contrast of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

CDK inhibitory fusion protein pl6p27.
CDK inhibitory fusion protein pl6p27.
Fusion gene, CDK inhibitor; cyclin-dependant kinase; p27 gene; p16 gclimeric polypeptide; human; binding motif; proliferation control; cell differentiation; cell-cycle inhibitor; proliferative disorder; tissue degeneration; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DPAAGSSMEPSADWLATAAARGRVEEVRALLEAGALPNAPNSYGRRPIOVMAMGSARVAE

Claim 63, Page 78-79; 88pp; English.

Closs, particularly CDK/cyclin complexes. It provides a recombinant transfection system (A) that comprises: (1) first gene construct transfection system (A) that comprises: (1) first gene construct comprising a sequence encoding an inhibition polypeptide containing at last one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (1) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (111) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic collycering the GCs to a cell for transfection. Also provided are nucleic polypeptide sequence (TCP) from an intranscellular protein that alters a cellular process when FP enters the cell, and (11) a transcellular collypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See X26220 for detailed uses of the recombinant transfection system. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cyclin-dependent kinase; CDK; CDK/cyclin complex; inhibitory; restenosis; CDK-binding motif; endothelialisation; fusion protein; therapeutic; acne; intracellular; transcellular; transcytosis; vascular wound; repair; hair; smooth muscle; cardiovascular; arteriosclerotic; fibrotic disorder; cellular proliferation; rheumatoid arthritts; diabetes; cirrhosis; graft; tumour; inflammation; neurodegeneration; periodontal; spermatogenesis;

Transfection system (A) that comprises: (1) first gene construct comprising assertion system (A) that comprises: (1) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at least one CDK binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (11) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for delivering the GGs to a cell for transfection. Also provided are nucleic delivering the GGs to a cell for transfection. Also provided are nucleic polypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (ii) a transcellular consists of at least one CDK-binding motif and a TCP. See x26220 for detailed uses of the recombinant transfection system. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Throsts and neurodegeneration

Claim 63; Page 74-76; 88pp; English.

The invention relates to novel inhibitors of cyclin-dependent kinases

CDKS), particularly CDK/cyclin complexes. It provides a recombinant

transfection system (A) that comprises: (i) first gene construct

comprising a sequence encoding an inhibitory polypeptide containing at

least one CDK-binding motif for binding and inhibiting activity of a CDK,

linked to a transcription regulator functional in eukaryotic cells; (ii)

second gene construct comprising a sequence encoding a polypeptide that

promotes endothelialisation, and (iii) a gene delivery composition for

delivering the GCs to a cell for transfection. Also provided are nucleic

collection and a construct of the complexity composition for conjecting a folypeptide sequence (TP) from an intracellular process when FP enters the cell, and (ii) a transcellular

cellular process when FP enters the cell, and (ii) a transcellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WAYDES,

polypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See X26220 for detailed uses of the recombinant transfection system. The present sequence represents a human p16(GS)p27 fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2, Application US/08848251
Patent No. 5989815
GENERAL INFORMATION:
APPLICANT: Skolnick, Mark H.
APPLICANT: Canon-Albright, Lisa A.
APPLICANT: Canon-Albright, Lisa A.
TITLE OF INVENTION: GENELINE MUTATIONS IN THE MTS GENE AND
TITLE OF INVENTION: METHOD FOR DETECTING PREDISPOSITION TO CANCER AT THE MTS
TITLE OF INVENTION: GENE
NUMBER OF SEQUENCE: 36
CORRESPONDENCE ADDRESS:
ADDRESSEE: Venable, Baetjer, Howard & Civiletti, LLP
STREET: 1201 New York Avenue, Suite 1000
CITY: Washington
STATE: DC
COUNTRY: USA
ZIP: 20005
COMPOTER REDABLE FORM:
MEDIUM ITPE: Floppy disk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 ELLLLHGAEPNCADPATLTRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLAEE 120

                                                                                                                                                                                                                                                                  Sequence 2, Application US/08589981
Patent No. 5672508
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
GYULIS, Jeno
APPLICANT: Lampher, Lou
APPLICANT: Baach, David H.
TITLE OF INVENTION: Inhibitors of Cell-Cycle Progression,
TITLE OF INVENTION: and Uses Related Thereto
NUMBER OF SEQUENCES: 4
CORRESSEDE: LAHIVE & COCKFIELD
STREET: 60 State Street
CITY: Boston
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 391;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1; Indels

Mol. Cell. Biol. (1995) 15:2682-2688
Identification of human and mouse pi9, a novel CDK4 and CDK6 inhibitor with homology to pi6(ink4).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mol. Cell. Biol. (1995) 15:2672-2681
Novel INK4 proteins, p19 and p18, are specific inhibitors of
the cyclin D-dependent kinases CDK4 and CDK6.
                                                                                                                                                                  ä

Cancer Res. (1995) 55:1607-1612
Association of rat pl51NK4B/pl61NK4 deletions with monosomy 5 in kidney epithelial cell lines but not primary renal
                                                                 Mol. Cell. Biol. (1995) 15:2672-2681
Novel INK4 proteins, p19 and p18, are specific inhibitors of
the cyclin D-dependent kinases CDK4 and CDK6.

swiss-prot38 1:swissprot Database:

Mean 44.859; Variance 85.215; scale 0.526 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: INTERACTS STRONGLY WITH CDK4 AND CDK6. INHIBITS ITS
ABILITY TO INTERACTS STRONGLY WITH CDK4 AND COULD ACT AS A NEGATIVE
REGULATOR OF THE PROLIFERATION OF NORMAL CELLS.
SUBUNIT: HETERODIMER WITH CDK4 OR CDK6.
FUNDERASE: CDKRIAM MUTATIONS ARE INVOLVED IN TUMOR FORMATION IN A
WIDE RANGE OF TISSUES.

Submitted (WAY-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: INTERACTS STRONGLY WITH CDK4 AND CDK6. INHIBITS THEIR
ABILITY TO INTERACT WITH CYCLINS D. COULD ACT AS A NEGATIVE
REGIATOR OF THE PROLIFERATION OF NORMAL CELLS (BY SIMILARITY).
-!- SUBUNIT: HETERODIMER WITH CDK4 OR CDK6 (BY SIMILARITY).
-!- ALTERNATIVE PRODUCTS: A SHORTER FORM MAY ARISE BY ALTERNATIVE
INTITATION CODONS IN THE SAME READING FRAME.
-!- SIMILARITY: BELONGS TO THE CDKNZ FAMILY OF CYCLIN-DEPENDENT KINASE
-!- SIMILARITY: CONTAINS 4 ANK REPEATS.
                                                                                                                                       Repeat: ANK repeat; Alternative initiation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hiral H., Roussel M.F., Kato J.-Y., Ashmun R.A., Sherr C.J.;
"Novel INK4 proteins, p19 and p18, are specific inhibitors of the
cyclin D-dependent kinases CDK4 and CDK6.";
MOI. Cell. B101. 15:2672-2681(1995).
-I- FUNCTION: INTERACTS STRONGLY WITH CDK6, WEAKLY WITH CDK4. INHIBITS
CELL GROWTH AND PROLIFERATION WITH A CORRELATED DEPENDENCE ON
ENDOGENOUS RETINOBLASTOMA PROTEIN RB.
-I- SUBUNIT: HETERRODIMER OF P18 WITH CDK6 (BX SIMILARITY).
-I- SIMILARITY: BELONGS TO THE CDKNZ FAMILY OF CYCLIN-DEPENDENT KINASE
                                                                                                                                                                                                                                                   63 PDLKDRTGFA-VIHDAARAGFLDTLQTLLEFQADVNIEDNEGNLPLHLAAKEGHLRVVEF 121

                                                                                                               CELLS THROUGHOUT THE BRAIN.
PTM: PHOSPHORYLATED AT WILTIPLE SITES BY DIFFERENT PROTEIN KINASES
AND EACH PHOSPHORYLATION EVENT REGULATES THE PROTEIN'S STRUCTURE
AND FUNCTION (POTENTIAL).
SIMILARITY: CONTAINS 24 ANK REPEATS.
DESMIN. ERTTHROCTE ANKYRINS ALSO LINK SPECTRIN (BETA CHAIN) TO THE CYTOPLASMIC DOMAIN OF THE ERYTHROCYTES ANION EXCHANGE PROTEIN; THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

ALTERNATIVE PRODUCTS: THE TWO BRAIN VARIANTS ARE PRODUCED BY ALTERNATIVE SPLICING OF GENE ANK2.

TISSUE SPECIFICITY: PLASMA MEMBRANE OF NEURONS AS WELL AS GLIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ANK MOTIF 3.
